HSIL HACKATHON 2026 — APRIL 11

Magic Gene

HSIL HACKATHON 2026 — APRIL 11

Magic Gene

AI workflow assistant for inherited retinal disease

Addresses HSIL Challenges

#1 EHR Analysis
#4 Fragmentation of Care
#6 Healthcare Worker Shortage

Post-Hackathon Roadmap

→ Expand step 1 variants

→ **Step 2: Patient report generation = today**

→ Expand step 3 usage in triage and treatment

1/20	1/2000	AU$5M
people affected by genetic diseases	people worldwide affected by IRDs	per person per lifetime in healthcare costs

6–8 months from genetic test to patient report — today. Clinicians are drowning in manual data wrangling.

The Pipeline — where Magic Gene sits:

1 Variant Filtering	2 **Report Generation**	3 Triage & Treatment
Sequencing → relevant variants	Genetic + clinical → draft report	Severity ranking → next steps
ROADMAP	★ HACKATHON FOCUS	ROADMAP

An approved gene therapy exists (Luxturna/voretigene neparvovec). Patients aren't receiving it fast enough. The pipeline is broken — Magic Gene fixes Step 2 today.

Magic Gene

Integrate patient history clinical data with variant testing

Competitive Landscape

Lookup databases such as Franklin, record platforms for electronic medical records

Business Model

Business to business
Subscription/Licensing

Go-To-Market Strategy

Niche: inherited retinal diseases

- Clear mutation-disease correlation with available gene therapy

Market: genetic testing laboratories, hospitals, eye clinics

Users: molecular biologists, geneticists

Pilot: one hospital department with de-identified data → validate data and publish for transparency

Expand: other genes, other diseases, other departments such as oncology, cardiology
